This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

PREFACE.

Fifty-three Volumes of the BOTANICAL MAGAZINE having appeared, the necessity of new General Indexes is, we believe, universally felt by the Subscribers; none having been published, except that which was given at the end of the Twentieth, and another full and very valuable one, at the end of the Forty-second volume; and which was prepared under the direction of its late excellent Editor, Dr. SIMS. The difficulty of forming that series of Indexes was acknowledged; and it may well be supposed, that the Work having increased to so much greater a length, and the advanced state of the Science having occasioned a prodigious change of names, the difficulty now, of constituting Indexes to the whole Work is proportionably increased; so as to render it scarcely possible to compile such, as shall be simple, for the purposes of reference, and, at the same time, useful, for its synonymy. In the present instance, we have found it necessary to differ from the arrangement of the Indexes to the earlier volumes, just alluded to, and we trust we have thereby rendered them even more intelligible.

From our own experience, we have found, that the enumeration of plants, in the order of the time of publication, is not attended with that degree of utility commensurate with the labor of the work, and the space it would occupy; and we have considered, that the Index of English Names required the number of each plate to be attached to it.

It has been an object with us to render the Indexes strictly applicable to the Work itself, and referable to

the names which they bear in it; or to those which may have been given to the plants in the best known and most standard Botanical publications of the day. The arrangement, then, is as follows: we have given,

I. An English Alphabetical Index;
II. A Latin Alphabetical Index; and
III. A Systematic Index, following the order of Sprengel, in the latest edition of Linnæus's Systema Vegetabilium.

The two first will be of essential consequence to those who have had their sets bound up according to the order of publication; the latter will be useful to those, who may wish to bind their sets systematically; or who may wish to see an arranged catalogue of the Genera and Species contained in the Work.

As many years may intervene, before it will be necessary to publish another General Index, we have added blank leaves at the end of this, for the convenience of those who wish to continue a Manuscript Index; and although this Index is complete for the Old Series, consisting of the first Fifty-three Volumes of this Work, several years hence, it may be desirable to amalgamate the Old and New Series under one General Index; we have, therefore, provided for such a contingency, by carrying the numbers on in numerical order beyond the Fifty-third Volume; and those who possess the whole of the Work will number their next Volume Fifty-four, disregarding the distinction of Old or New Series, which has been made principally to mark a new epoch in the arrangement under a new Editor, and to give many an opportunity of commencing the Work conveniently, who may not have the means of purchasing the former Series.

MEMOIRS

OF THE

LIFE AND WRITINGS

OF THE LATE

MR. WILLIAM CURTIS.

Several sketches of the life of the late Mr. William Curtis have appeared in different forms before the public eye; but none has been attached to the Botanical Magazine, which was one of his principal Works. It was therefore thought desirable, that a short Memoir should be affixed to it, as affording matter of interest to the Subscribers, many of whom were the personal friends and acquaintance of the late author.

It would be useless and unentertaining to enter largely into the early life of a person who had to struggle with the world in a profession he did not like, not only for his own maintenance, but to provide for sundry little expences his adopted fancy required, and which claimed every moment of his leisure, as well as time also borrowed from his professional duties.

The subject of this Memoir was born at Alton, in Hampshire, in 1746, and educated at a village called Hollybourn, about two miles from that town (not at Burford), and at a suitable age was placed as an apprentice to his grandfather, in the same town, to learn the Arts and Mysteries of the Medical Profession. After going through the routine of studies requisite to his commencing practice on his own account, he left his native town for London, carrying with him his favorite taste for Natural History in every branch,—a taste in unison with Medical research, if

the possessor is in sufficient affluence to indulge in so wide a field. Not so our friend, who was doomed to live by his profession; which took up his time, whilst his thoughts were roving after Plants, Birds, Insects, &c. He was a short time an assistant to Mr. George Vaux, of Pudding Lane; and afterwards with Mr. Thomas Talwin, of Gracechurch Street, a gentleman in an extensive practice, whose business he afterwards purchased; and from necessity, rather than choice, kept up a practice, which, in all probability, would have proved more lucrative than his after pursuits did, had it been congenial to his mind; but he was so much occupied in his favourite studies of Nature, that he would have lessened his professional practice had he not taken a partner into it: thus setting himself more at liberty to pursue his inclinations, at the expence of sacrificing half its emoluments.

The partner selected for keeping together their Medical practice (Mr. Wavell) was also of the same turn of mind, although less ardent than Mr. Curtis. They were engaged in the same pursuits at all leisure opportunities; and one of their herbarizing excursions on Clapham Common, brought about an interview betwixt Mr. Wavell and some rich relation of his at Richmond, which shortly ended in marriage with a Miss Smith, a visitor there. From Mr. Wavell's good fortune, and the desire of Mr. Curtis to leave the profession altogether, and follow his adopted fancy, he sold the whole of his practice in Gracechurch Street to Mr. Wavell; and taking a piece of ground, in the Grange Road, Bermondsey, first commenced the cultivation of plants, towards the formation of a regular Botanic Garden. Whether Mr. Curtis continued long with Mr. Wavell afterwards is uncertain; but it is probable, a close intimacy was kept up betwixt them, until they both left the City altogether: Mr. Wavell for Edinborough, where he took out his diploma, afterwards establishing

himself as a physician at Barnstaple; and Mr. Curtis for the entire pursuit of the Natural History of his own country. It is certain, that up to the death of Mr. Curtis they kept up a friendly correspondence. [Mr. Wavell disposed of the old established Medical business in Gracechurch Street, to Mr. Cleaveland, who afterwards moved to the corner of Dowgate Hill and Cloak Lane, where he died.]

Thus unfettered, as to his pursuits, Mr. Curtis was left to the bias of his own mind; and had his pecuniary concerns been flourishing, he would have earlier began the development of those plans, which had budded, and were ready to shoot forth; but which were not only retarded, but almost stifled for want of means to bring them forth. At this momentous period of Mr. Curtis's life, when he was anxiously enquiring into every branch of Natural History, being of an excellent temper, and a warm heart, he courted and was courted by almost every one of congenial habits about the metropolis, who had a turn for the same pursuits of life. He collected and studied all the useful works which had been written on the subject; was in constant communication with almost every scientific person throughout the country, and most of the distinguished foreign Naturalists of his time: thus gleaning from all, and not only storing his own memory, which was very retentive, with the most useful knowledge of his subject, but committing, in methodical order, every thing that could be of lasting use to himself and the science to paper. His facility of writing a short-hand freely, rendered this an easy task.

We would at this period, from 1770 to 1780, draw the attention of the scientific student to the materials then in the power of Mr. Curtis to call in to his aid. Scarcely a well approved list of names existed; and the whole mass of information was so unorganized, that in the present times it would not easily be believed. With the exception of the la-

bours of Ray, Hudson, Sir John Hill, and Miller, the knowledge of plants and their uses was but little better understood than in the times of the writers of the old Herbals. From this chaotic mass order was to be brought forth, by strictly examining every plant then known; observing all that had previously been written on it; and by the most scrutinizing observation of its habit, uses, and favourite places of growth, to draw forth the probable conjectures of how far each plant might be made more useful to man under proper culture. Here was the field laid open; and although an undertaking scarcely within the compass of a long life to accomplish, it was arently entered on, and pursued with zeal during the remainder of his life.

His discernment into the hitherto hidden parts of nature was soon appreciated by his friends and acquaintances. His friend Mr. Hudson, the well-known author of the Flora Anglica, gave up his appointment in the Apothecaries' Company, and, in 1772, Mr. Curtis was elected to the vacant office of Demonstrator of Plants and Præfectus Horti of that Company, an office more honourable than lucrative. His ardour in accepting this appointment was for the advancement of the scientific knowledge of plants; and he proposed to give Lectures on this branch of his profession (Medical Botany) before the members and students in medicine, at the hall of the Company, which proposal was accepted by the Committee at that time; but what prevented its being carried into effect does not appear. He continued in this office until 1777, when he resigned it for want of time to attend to the duties of it, and was succeeded by his friend Mr. Thomas Wheeler.

His zeal for the advancement of Botany was too ardent to be restrained by the want of proper artists to enter into his views of the subject; and one of his first productions was a Key to the Linnæan System, which he drew and etched himself [This incident must have given him the

credit of being a draftsman and engraver with Dr. Thornton, who wrote a sketch of the life and writings of Mr. Curtis, to accompany the three volumes of Mr. Curtis's Lectures.]; but although his eye was as correct as any one's, in discovering the slightest error in the drawings of others, he never could draw well himself. Mr. Curtis about this time, also, published a valuable little tract on the Classes and Orders of Linnæus, with two plates, coloured, illustrating the subject most clearly. This he dedicated to his friend John Gideon Loton, Esq., and it had a very considerable sale. Several of his smaller works, such as the Fundamenta Entomologiæ; Plates, &c. to illustrate the Materia Medica; a work on Ornithology; a history of the Brown-tailed Moth; and several others, were never pursued to a sufficient extent to deserve particular notice at this time; but in them was laid the foundation of several excellent after publications, on the same subjects; such as Dr. Woodvill's Medical Botany, &c.

Mr. Curtis was unusually correct and critical in every subject on Natural History which came under his notice. But, as notes and descriptions are not complete in describing plants of very near affinity to each other without drawings, Mr. Curtis early felt the want of a correct artist, under his own guidance, to set forth the nicer distinctions; and, for this purpose, he became acquainted with an artist of the name of Kilburn, who lived in the neighbourhood of his garden, in the Grange Road. This artist made many excellent drawings of plants, under the immediate inspection of Mr. Curtis, some of which bear his name on the early numbers of the Flora Londinensis; but the excellence of his drawings attracted the notice of some of the principal calico printers of that day, who enticed him, for better pay, from Mr. Curtis; and he afterwards became eminent in that business, at Beddington Corner, near Croydon, where he died in comparative affluence.

It does not appear in any of Mr. Curtis's papers, at this early period of his researches, that he constantly employed any one artist; but as cases occurred, requiring faithful representations, he sought and became acquainted with those who had good taste in drawing from nature. Mr. Milton, the celebrated engraver (a descendant of the eminent poet), assisted Mr. Curtis at this time; although his after avocations rendered his time of too much importance to be long retained in this inferior branch of his art. But it is most likely, from Mr. Curtis's finances, and the constant occasion he had for a person who could readily delineate on paper the nicer distinctions in plants, that he found it requisite to bring up in his own habits, an artist of his own selection. Mr. Sansom was at first intended to have supplied this place; but his skill was more confined to engraving, than drawing from nature. Several of the early plates of the Flora Londinensis and Botanical Magazine, however, bear his name as draftsman and engraver; and he continued to engrave the whole of the plates of the latter work until he became blind, several years subsequent to the death of Mr. Curtis; after which calamity, his son executed them for the remainder of both his father's and his own life. But the artist of most use to Mr. Curtis was Mr. Sydenham Taste Edwards, who was introduced to him for the purpose of his patronage, by a Mr. Denman; who (if we are not mistaken,) was, at the time, town-clerk of Southampton; and Mr. Denman being of a scientific turn of mind, and happening to be at Abergavenny, noticed young Edwards, whose father was a schoolmaster, and the organist there. Young Edwards, whilst a boy, had copied some of the plates of the Flora Londinensis, which were shewn to Mr. Curtis; who was so pleased with the performance of them, that he sent for him to London, and had him instructed in drawing, &c.; in which he improved very rapidly, and soon became able to

draw and etch the plates of the Flora Londinensis and the Botanical Magazine. The drawings of the Magazine were entirely his own for many years, and were executed with a correctness not before known in periodical publications. It was not to plants alone that Mr. Curtis had directed the genius of Edwards; he attended him on most of his excursions into the country, in search of Natural History; and whenever any curious bird was shot, any curious insect taken, or any natural object of curiosity presented itself, it was his business to make a correct drawing of it; to which Mr. Curtis attached a most minute description; which was often so intermixed with short-hand, for brevity sake, as to be unintelligible to most persons but himself; more especially as many of his characters were his own. In this manner many years were spent; and Edwards was the companion, rather than the servant of his patron up to the death of Mr. Curtis; at which time, materials, on subjects connected with Natural History, had accumulated to a very great extent; but which were doomed to a state of uselessness by this much to be regretted event. After the death of Mr. Curtis, Edwards continued for years to draw entirely for the Botanical Magazine; which taking up but a small portion of his time, he was noticed and employed by many persons of distinction, who were either fond of science, or lovers of correct and highly finished drawings of plants or animals. He published a work on dogs, in large quarto, on his own account; and it would have been more in unison with common gratitude; and more to his own peace of mind, in his last illness, if he had not been persuaded to begin a work in direct opposition to the Botanical Magazine; by which he had risen, and which work, after his patron was dead, was the support of his widow, daughter, and grandchildren. Besides, there was no necessity for such a work, as the public were well satisfied with the Magazine, in every respect, without

burthening science with another exactly the same except the title; which Mr. Gawler and Mr. Edwards to distinguish it from "Magazine" called "Register," and charged it a higher price. The principal merit of the Botanical Register, and for which it was in the beginning patronized, has many years ceased to exist; and Mr. Edwards left an opposition to the Magazine without the means of continuing its merits. Prior to Mr. Edwards being able to draw for the Flora and Botanical Magazine, Mr. Curtis was in the habit of employing, not only as a colourer, but afterwards as a draftsman and engraver, the late Mr. James Sowerby, whose name appears on many of the plates in each work. This artist, in conjunction with Doctor (now Sir James Edward) Smith, brought out the octavo work called English Botany, in opposition to Mr. Curtis's Flora Londinensis. This unexpected opposition, from supposed friends, cost Mr. Curtis much uneasiness. But the two works, when compared together, for execution and price, will, as Dr. Thornton observes, "leave the first work of Mr. Curtis to shine with undiminished splendour."

Although this may seem a long digression from our object in this memoir, it seemed of sufficient importance to explain the trouble and difficulties Mr. Curtis had to contend with in his early career, to produce those parents of most of our esteemed modern coloured works on the same subjects; and as reasons for the slow progress they made, particularly the Flora Londinensis. The ground was new and unexplored; and the patrons, although ardent, were too few to support a work of its price, although published so low. Had Mr. Curtis increased the price of the work at its commencement, it would most likely have paid him very well, as few short of the same number would have been sold; whereas it was published so near its actual cost, as, with the outlay upon the stock remaining on hand, involved the author in difficulties, which his best friends were sorry to see.

But, although it is difficult to find a friend in need, yet such a one stepped forward at this juncture in Dr. Lettsome, the well-known patron and encourager of all scientific pursuits, who had long been a friend and pupil of Mr. Curtis's; he generously offered to lend him five hundred pounds, with which assistance, the work moved on regularly for a time. But as Mr. Curtis had kept up the work out of the profits of his other concerns, he had rendered himself poor; and on the completion of the sixth fasciculus, making in all seventy-two numbers, he closed the work; partly from its being too great an outlay to conduct; and because his health began to decline. (This work, although since continued at so great an advance in price, has gone on very irregularly, and not been very productive.)

Although Mr. Curtis's proposal for reading Lectures on Botany to Medical Students, at the Hall of the Apothecaries Company, was approved by the Committee, but not carried into effect, he wrote a Course of Lectures, which he read to a numerous body of Medical Students, as well as persons interested in vegetable economy.

The manuscript of these Lectures, with the drawings to illustrate them, Mr. Curtis gave to his daughter; which coming into the possession of Mr. Samuel Curtis (her husband) he published them, in three volumes octavo, to match the Botanical Magazine in size, which sold very well; but, it is feared, the spirit of them, as delivered by the author, was much wanting, as a great deal of his short hand, with which they were frequently interlined, could not be made out. In these Lectures he was well attended, as well as in his herbarizing excursions to a few miles round the environs of London; and, at the same time, establishing his Botanic Garden at Lambeth Marsh, he seems to have been almost the first regular teacher of Botany that we have heard of.

Mr. Curtis now further developed his plan for disseminating Botanical knowledge. Having made himself more

completely master of the subject than any other person, he commenced, by issuing the following proposals.

" It must be allowed, that all human knowledge ought to be subservient to the good of society; and in proportion as this is advanced by any science, so ought that science to be held in esteem.

" Providence, in his unerring wisdom, having allotted to mankind different capacities, and implanted in them propensities to particular pursuits, so that what is matter of the greatest satisfaction to one, shall be perfectly insipid to another; it is no wonder that they should differ so widely in the apprehended utility of their respective employments; each, from a principal predominant in the human mind, being willing to think his own of the greatest importance. And so strongly is this idea impressed on the minds of some, as to betray them into narrowness of thinking, inconsistent with that liberality of sentiment, which would excite a wish for the universal increase of science, when connected, even in the remotest degree, with the interests of mankind. Without derogating, then, in the least from the utility of other arts, I shall, in a few words, endeavour to point out the advantages of Botany; a science which this design is particularly intended to promote.

" Among all the studies which engage mankind, few are attended with circumstances equally pleasing in their pursuit; few can boast that infinite variety of objects, which are perpetually engaging our attention, and inviting us to partake of pleasures equally rational and innocent.

" It is a science, which has been cultivated by the wisest of mankind; and particularly, by the most distinguished professors of the Medical art. Here, as philosophers, we may admire and contemplate the wonderful works of an Almighty Being. What an infinite display of wisdom is observable in the different modes of the growth and propagation of plants! What care is taken in perpetuating

the succession of each species! How admirably are they adapted to grow in every different soil and situation, so as to leave no part of the globe, not even rocks and stones, uncovered! With what regular order, and in what constant succession do they flower and produce their seeds! In short, a person of an inquisitive or contemplative turn, will find in plants, an endless source of innocent delight. Another world, as it were, opens to his view; he beholds the face of nature through a new medium of vision; and has the superior pleasure of being able to read in that book, which, to the generality of mankind, is a mere blank. The importance of this science, as a branch of Medical knowledge, is happily expressed, by the late ingenious Dr. Gregory, the ornament of his profession, and, I may add, of human nature. In his advice to the young physician, he thus delivers his sentiments on this head. 'The Science of Botany is subservient to the practice of physic as far as it facilitates the knowledge of plants, by reducing them into the most commodious and perfect system; and although it is not necessary to be particularly acquainted with the name and history of every plant, yet every one ought to be so well founded in the principles of Botany, as to be able to find its place in the system, and to describe it scientifically: and we ought to be particularly acquainted with every material circumstance relative to those plants which are used in medicine.'

"It is, however, to be much regretted, that this pursuit is so little attended to by gentlemen of the faculty in this country: hence they are often obliged to depend upon the skill of the ignorant and illiterate, for many of their efficacious officinal plants, frequently at the expence of their own characters, and of all that is valuable to their patients. Although newly discovered chemical remedies and foreign drugs may have justly superseded many of our English plants, yet a great number are still retained in our

Pharmacopœias, and many possess, very poisonous qualities; to be acquainted with these at least, is the duty of every one that takes on himself the important character of guardian of the health of mankind.

"But it is not to physic alone that Botany is subservient; perhaps it is applied with as much advantage to Agriculture, which is still extremely defective. In this enlightened age, when arts and sciences are carried to a pitch unthought of in former times, we might expect a nation celebrated not less for its arts than its arms, would be the first to promote a science, whose improvements are the only solid check to the baneful and enervating effects of luxury and dissipation; and, accordingly, we find many of our nobility, gentlemen of landed property, and public societies, fully aware of its importance, and endeavouring by premiums, and a variety of other means, to improve it. Much, however, still remains to be done; nor is it probable that their endeavours will be crowned with success, till Botany is more cultivated, and plants, particularly the Grasses, better understood.

"How incapable most of our modern writers on agriculture are, of communicating their discoveries for want of botanic information, and how much the progress of this most useful science is thereby retarded, must be obvious to all those who have perused their writings with any degree of attention.

"I am inclined to suppose, that this inattention of the faculty and others to Botany proceeds, in a great measure, from a want of opportunity to acquire it; and that if the means were afforded, there would no longer be cause of complaint or censure.

"To afford the means of obtaining this knowledge is the object of the present institution;—an institution which has been attended with considerable expence, and cost the author much time and attention. Should he have

the pleasing satisfaction of seeing it become productive of national utility, that time he shall think usefully employed, and that attention most happily bestowed.

"The more effectually to succeed in promoting the knowledge previously recommended as so essential to the interests of individuals and the community at large, he has selected from the boundless field of vegetable productions, certain classes of plants, universally acknowledged to be either the most useful, or the most necessary to be known; by which means the student's attention is more immediately directed to the objects of his pursuit. These are the Medicinal, Culinary, Poisonous, Agricultural, and British plants; all of which classes are kept in separate and distinct quarters, expressed in the plan of the garden. To these are added two other quarters; the one containing such plants as are calculated to instruct the student in the principles of the Linnæan system, being living examples of most of his classes and orders; the other furnished with hardy, ornamental flowers and shrubs, chiefly exotic, and cultivated in the gardens of the curious.

"As the practical part of Botany, as well as of every other science, is the most useful, so it is presumed, the mode of communicating this knowledge is such as will meet with general approbation: this is effected by having the generic and trivial name of each plant, according to Linnæus, painted in a legible hand, and affixed to it; and that none may lose the advantage of acquiring a knowledge of plants from a non-acquaintance with Latin, the English names also are added, with a view, that Botany, in this familiar dress, might be instructive to those whom the bare mention of a long hard-sounding Latin name might tend to discourage. And the author is ready to flatter himself that many persons, who are naturally fond of plants and flowers, will be ready to encourage an undertaking of this kind; by which, at the same time that they

indulge their particular taste, they may insensibly acquire knowledge.

"It has been objected by a few, that a knowledge of plants thus easily acquired, is as easily forgotten; but this must certainly be more the fault of the students than the method; as they may without molestation spend as much time as they please in investigating them, and becoming perfectly acquainted with their characters; and still farther to assist them in their studies, a library of those books most necessary for the students is open to their inspection."

The above proposals being circulated, his Lectures and herbarizing excursions well attended, and his Botanic Garden established, the encouragement Mr. Curtis met with from very distinguished characters of that time was very flattering; and it is still in the recollection of several of his pupils, how pleasant a manner he had in explaining whatever could be useful or interesting to every one, whilst engaged in collecting specimens on these excursions.

Amongst his greatest encouragers and pupils, he had to enumerate the family of the Earl of Bute, Sir Joseph Banks, the Hon. Daines Barrington, Dr. Fothergill, Dr. Lettsome, Dr. Goodenough, (late bishop of Carlisle) Thomas White, Esq., and many of the most celebrated enquirers into Natural History of his day. These, and many others who wished well to the science, or to encourage the teacher, became annual subscribers to the garden; which was not only the support he had to depend on for himself, but the only means he had to establish so expensive a plan as a regular school for studying plants from nature, under a systematic arrangement of them; and to form a collection of books for reference in the garden library, to be consulted at all times by the pupils and subscribers.

At the same time a printed catalogue, with an engraved plan of the garden, arranged into quarters, expressive of the different qualities of the plants they contained,

such as, the Medical, the Culinary, the Agricultural, the Poisonous, the British, &c., was given to each subscriber; which catalogue contained very appropriate remarks on each head, to direct, and stimulate the student to improvement. We shall, in this place, transcribe his preface to the quarter containing British Plants; and that, because it shews, in his own words, how slender were the means to accomplish so great an undertaking at that time.

On the fifth, "BRITISH PLANTS," is given the following admirable preface. "To the distinguished abilities, unwearied assiduity, and communicative disposition of Mr. Ray, assisted by many of his contemporaries, we are indebted for the first British Flora, which could in anywise be considered as complete; such was his 'Synopsis Stirpium Britannicarum,' the third edition of which still remains to be deservedly valued. In this work we have an enumeration, and frequently a description, not only of the more perfect plants, but also of the Musci, Fuci, Fungi, &c., all arranged according to a system of his own. To this system of our great predecessor succeeded that of the celebrated Linnæus, the ornament of Sweden; the excellence of which was such, as to create general admiration, and insure it an almost universal reception: hence it became necessary (if I may be allowed the expression), to Linnæanize Mr. Ray. This arduous task was attempted by Mr. Hudson; and Mr. Ray's Synopsis, to speak metaphorically, transmigrated into Mr. Hudson's Flora Anglica; in which form, though it retained the advantages of a new body, it lost a portion of its original spirit; much useful information being suppressed, and many distinct species made into varieties: it was, however, enriched with many new plants, discovered by Mr. Hudson and his friends.

"In the year 1777, Mr. Lightfoot having accompanied Mr. Pennant into Scotland, for the purpose of making discoveries in Natural History, favoured the public, on his return, with an ample account of the plants discovered in

his Northern tour, under the title of 'Flora Scotica;' the value of which was greatly enhanced, by the new lights thrown on the cryptogamous plants in general; and the excellent plates of several rare plants which accompanied it. In the succeeding year appeared the second edition of Mr. Hudson's book, in which the plants of the Flora Scotica, with many additional ones, previously discovered, were inserted. The works of these three different authors, the only practical ones of any note that have been published in this country, form the basis of the present catalogue. Where I have not had an opportunity of observing or cultivating the plants which they enumerate, I have relied implicitly on their accuracy; where I have, as an enquirer after truth, I presume I should have been censurable not to have used the lights, which perhaps a more minute enquiry, or better opportunities of cultivation, had afforded me; hence I have in several instances differed, both from Mr. Ray and Mr. Hudson, and am sorry to have occasion to differ so materially from the latter, in the account he has given of the Grasses, in the second edition of his work. The reasons at large for such differences will be given in the Flora Londinensis (vid. RANUNCULUS *hirsutus*, POLYGONUM *minus*, SEDUM *sexangulare*, &c.): the only notice taken of them here, will be to print in Italics those plants which I apprehend to be species, and which Mr. Hudson considers as varieties. As the garden contains more than two-thirds of the more perfect British plants, it was apprehended, that the addition of the remainder, which either cannot be made to grow, or have not yet been obtained, would render this publication more useful, not only to those who may have opportunities of visiting it, but to those also who have only the garden which nature affords them: they are incorporated with the rest, and distinguished by having no figures prefixed to them. Such as have an asterisk, are considered as doubtful natives."

This catalogue of about six thousand plants, and the

practical arrangement of the garden before the eyes of so many curious enquirers on the subject, may be considered the first great step towards the scientific arrangement of a Botanic garden. The foundation being laid in this first attempt (for his garden in the Grange Road was only to cultivate without arrangement), Mr. Curtis, during the remainder of his life, laboured to improve, both by practice and precept; in which he was so far successful, that he lived to see his example followed by many, and a general taste diffused for his own favourite study.

Mr. Curtis not only made his researches into the curious, but the useful; and he never lost sight of the best purpose to which science can be applied—the benefit of mankind. We cannot forbear transcribing his remark on the Agricultural plants, because for its brevity, we cannot better explain his then notions on this important subject: he says, "it is presumed the present catalogue is the first of the kind ever offered to the public; it will be no wonder, therefore, if it should fall short of perfection. Most of the plants contained in it are of British growth. Of the useful ones, many have long been known and cultivated in this country. Several new ones are inserted, as deserving to be more generally known to the husbandman; of these, the Grasses, a much neglected tribe, form no inconsiderable part. At present, out of a hundred and three species, the produce of this country, considered by surrounding nations as most fertile in its herbage, only one is cultivated for pasturage, and that confessedly deficient in many of the requisites of a good grass. Mr. Stillingfleet, in his Miscellaneous Essays, has taken much pains to recommend several others as superior; and about as many more are here added from my own observations. If the agriculturist has been inattentive to the plants of the useful kind, the noxious plants have engaged still less of his attention, though highly deserving of it. Future observations will doubtless

make it necessary to add many other plants to those here enumerated; perhaps retrench some of the present list; and throw a much greater light on the whole." What Mr. Curtis at this time only surmised, he found to be correct in practice. He cultivated plots of the most likely to be useful Grasses; and, after careful examination of the result, put forth a most useful pamphlet on the subject of the Grasses, which has improved the state of agriculture in that department more than any other work.

Mr. Curtis's writings were, for his extensive knowledge, few in number, as he seldom gave his thoughts to the public, but for their benefit, and with rather two scrupulous a regard for his own gain, considering his circumstances. Of this description, but with a laudable view to allay the dreadful apprehensions of many persons of impending famine and pestilence, he wrote his treatise on the Brown-tailed Moth; whose destructive ravages in 1783, in the Caterpillar state, were considered as a pestilence and public calamity.

The lovers of horticulture may also thank Mr. Curtis for introducing amongst their Culinary vegetables, the Crambe *maritima*, or Sea Kale, now so common in the markets, and on their tables; to bring which into general notice, he published a pamphlet, and, with each pamphlet, sold a box of the seed; and that it might be the more speedily brought into common cultivation, he planted a large plot of it, which he sold or distributed amongst his acquaintance.

Hitherto we have said but little of the Botanical Magazine, the only work which has been of material assistance to Mr. Curtis. In comparison of the productiveness of the two works (the Magazine and the Flora Londinensis), to use his own expression, "One brought him pudding, and the other praise." The idea of such a work was new, and on its being talked of amongst his most intimate acquaintance,

he was strongly recommended to carry it into effect; and amongst those who were most earnest for it, we believe Robert Barclay, Esq. (now of Bury Hill, near Dorking) was very sanguine of its success; perhaps, little thinking that, at a future period, he should prove the most valuable contributor of new and rare subjects to it. Accordingly the work was commenced in 1787, in monthly numbers, at one shilling each, containing three plates in each number, with three descriptions; and although afforded at so cheap a rate, and so beautifully executed, such was its sale, that it placed him in easy circumstances, although he had so many unproductive schemes in hand at the same time. During the life of Mr. Curtis, the monthly sale was about two thousand copies of the current number; and from the number of reprints since its commencement, it is supposed of each of the early numbers upwards of five thousand have been issued. Mr. Curtis conducted this work, from its commencement to his death in 1799, regularly every month; and left a large store of materials for its continuation, under the direction of one of his executors, Dr. John Sims; who, from the 172d number, for the more convenient division of the paper to half a sheet, increased it to four plates in each number. But, about this time, the love and knowledge of rare plants began to have an ascendency amongst the middle classes of society, and it was thought advisable to increase the quantity still farther. Accordingly, the number of plates was doubled; and each number has since contained eight plates, with descriptions. Although it had a very extensive sale after this increased quantity, and advanced price, still many of those who spent their shilling per month would not go so far as three shillings and sixpence, so that the sale of the current number was very much reduced; and from the commencement of the Botanical Register, and several works of a similar nature, the quantity per month was re-

duced to about one thousand copies; and at the present time is considerably below that number.

Last year, 1826, Dr. John Sims, at an advanced age, gave up the editorship of the work, and retired from his practice and London altogether, and has settled at Dorking in Surrey, in quiet retirement. Mr. Samuel Curtis (who married the daughter of Mr. William Curtis, the author of it) has become the sole proprietor, and is conducting it, under the editorship of Dr. Hooker, the Regius Professor of Botany in the University of Glasgow, under whose able and judicious selections, and whose great taste and skill in the drawings, with the addition of minute dissections to completely illustrate every part of the subject described, it is hoped that the work will meet with the extended patronage its merit deserves.

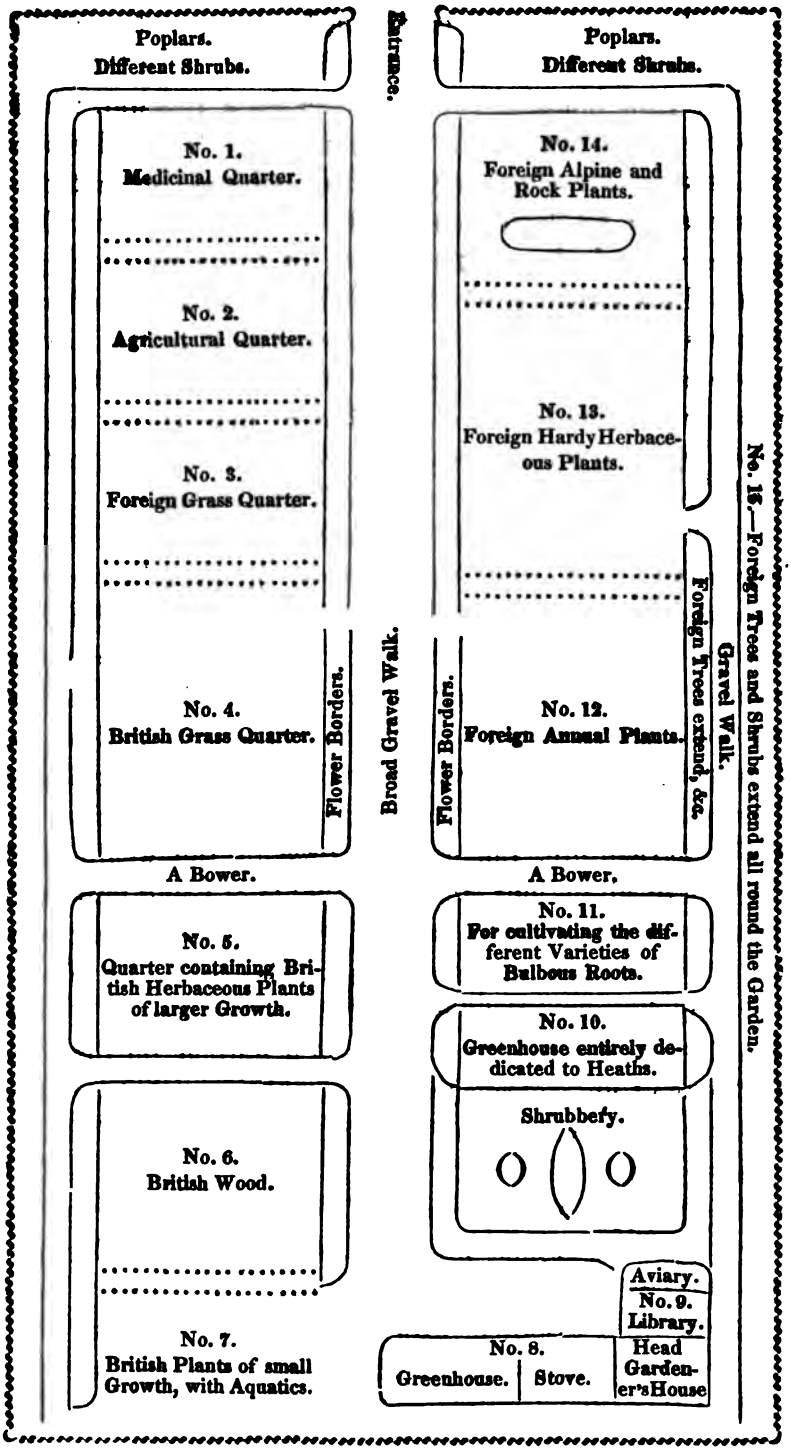
We forbore, in the long article we made on the artists employed by Mr. Curtis, to mention one, as coming more properly in this place; we allude to Mr. William Graves; whose name cannot appear on the work, like the drawer or the engraver, but whose skill is set forth on the face of almost every plate: for, singular to relate, he was the constant, undeviating friend and assistant to Mr. Curtis, from the time he commenced business in 1771, and has continued to colour the whole of his works from their commencement. From such extensive practice, it is supposed he has coloured more plates on Natural History than any living artist in the same time; and even now, at the age of seventy-three, is in full and lively possession of every faculty; and we could even call the attention of those capable of judging of his art to the volume of the present year, as a comparison with any work extant.

To return to the period of the commencement of the Botanical Magazine, we find Mr. Curtis at his garden at Lambeth Marsh; where, although the situation was most unpropitious for many plants which cannot bear the smoke

of London, still, he was unwilling to quit a spot on which he had bestowed so much time and labour, until the lease expiring, his landlord exacted terms for a renewal, which were too extravagant to be complied with. To use his own expressions, Mr. Curtis says, "disappointed, but not disheartened, I resolved to attempt its re-establishment elsewhere. I looked over the names of those who had patronized my former attempts, and finding that the majority of my subscribers resided to the westward of the city, I fixed on a spot at Brompton, with the advantage at least of some experience in the cultivation of plants; and here I have witnessed a pleasure I had long wished for, that of seeing plants grow in perfect health and vigour.

"That I have good grounds also to expect that my labours will be crowned with success, the list of those persons who have honoured my garden with their subscriptions the first year of its formation, affords me the most pleasing proof. Indeed, whilst vegetables shall constitute a part of our food, and there is a necessity to distinguish wholesome, from poisonous ones;—whilst medicines for the cure of our diseases shall be drawn from the vegetable kingdom;—whilst agriculture, the grand source of the wealth and strength of all nations, shall be capable of being improved by a closer attention to our native plants—whilst Botany shall be studied as an instructive science, or as an object of rational amusement—or whilst the beauties of nature shall have power to charm; so long a garden, on the plan of the one I am endeavouring to establish, will, I humbly presume, meet with the support of the public." The Botanic Garden at Brompton and its appendages occupied about three and a half acres, and he had about seven acres more adjoining which was used for Sea Kale, and experimental ground for agricultural crops, &c. The various quarters were disposed with plants of similar growths, systematically arranged to the best advantage for the student thus:—

A Plan of the Botanic Garden at Brompton.



The plan being completed, and the plants from his Lambeth Marsh Garden being arranged in it, the constant desire of procuring additional species, and propagating for extensive dissemination those possessed, was one source of active and profitable amusement. His old pupils situated in every part of the kingdom were pleased to keep up a friendly correspondence with him; and the discovery of native plants, which are thinly scattered over the face of the country, or living specimens of rare hardy exotics, often gave them an opportunity of increasing his collection, and gratifying themselves, with a renewal of his former friendship. The works which he then periodically carried on continued also to occupy a portion of his time. Still his active mind was constantly planning improvements on the then deficient parts of the Natural History of this country; and his preparations of drawings and descriptions, whether of plants (especially in cryptogamia), quadrupeds, birds, fishes, or insects, were now become very numerous, but not complete enough, to his mind, to enter into such an arrangement, as his ardent wishes aspired after. He made a journey to Settle, in Yorkshire, to explore the native plants, &c. of the hilly country around that part of the kingdom; from whence he brought some excellent gleanings; and afterwards to Mersea Island, on the Essex coast, during the season for taking wild fowl. Here he had an opportunity of getting excellent specimens of the scarcer water fowls which migrate, and only visit our shores in the most intemperate of seasons; at which place, the incredible number of them would astonish any one not acquainted with the subject. Here, with Edwards at his elbow, was a scene of enjoyment to him; and a great quantity of drawings were made. He also entered minutely into the mode of taking the young oysters (called here the Spat), by dredging for them, which are afterwards laid on mud beds, flooded by the sea

at every tide to feed. The apparatus for every part of this operation was minutely drawn and added to the store. Thus years passed on, adding highly finished drawings by Edwards, and his own minute description to each, until, about 1797, when commenced the uncomfortable feelings on his chest, attended, at times, with extreme nervous irritability, from which he was seldom free long together to the time of his death. This uncomfortable sensation made him thoughtful of the state of his property; and having no one in his family who was likely to succeed him in his garden, he cultivated an acquaintance with Mr. William Salisbury, who was at the time the gardener of —— Simmons, Esq., of Paddington; and for the introduction of him to the Botanic Garden (more as a profitable business, than as a learned successor, to support the well-merited fame of its founder) he was associated as the partner of Mr. Curtis, and an agreement was entered into, that on Mr. Curtis's demise, Mr. Salisbury should pay certain annual sums as interest, until he paid six hundred pounds principal money, for the whole establishment as it then stood, with houses, library, &c. This sum was paid by Mr. Salisbury, who continued the garden many years after the death of Mr. Curtis; but removing it to Sloane Street, in hope of more patronage, the spot was neglected, and is now part of a nursery ground, with few vestiges of its former state. Mr. Curtis, in his will, left the money arising from the Botanic Garden and other sources, with the property of the Flora Londinensis and the Botanical Magazine, to his widow and daughter; and the control and management of his works and papers to his friend Dr. John Sims, one of his executors; but it was not thought advisable to add to the Flora Londinensis, on account of the unavoidable heavy expences of it; and it was sold, in 1813, to Mr. George Graves with a few old

copper plates of birds which he afterwards published, purporting the work to be part of the late Mr. Curtis's, who had little or no hand in it.

We cannot, perhaps, conclude this memoir of Mr. Curtis better than with the concluding article in the sketch by Dr. Thornton, which is in its main parts, very correct.

"The reader may here expect us to say something on the character of Mr. Curtis. No one ever showed from the earliest period a greater love for Botany, or ardour in its pursuit, than Mr. Curtis. His eye was truly microscopic: for seldom had he recourse to a glass to examine the smaller parts. Nothing escaped his remark, and his discernment was most critical. His descriptions of plants are therefore perfect. Neither too profuse, or contracted, these are models for our imitation. Able to draw himself, and engrave, which appear in him to be self-taught, he could direct the artist to express what he himself felt; and if ever he suffered his mind to be ruffled, it was when the painter had not fulfilled his part exactly to his mind.

"He was patient of bodily labour; and careless of what he partook in his reseaches after plants. Bread and cheese and beer, or eggs, were his usual repast when herborizing; and this chiefly with a view not to lose his time. He rapidly traversed on foot, considering his make, a prodigious extent of country; and he suffered nothing to escape him. It was wonderful the multitude of plants he found growing upon any spot; for when herborizing with a large party, his keen sight always collected twenty times as many different plants as were obtained by the whole company. Although thus superior, no one was more modest or diffident. He never indeed boasted, and but seldom spoke of himself. When correcting an error, he performed the task in the handsomest manner; ever accompanying his remark with some previous compliment to the person. He was

studious not to give offence. Truth was his delight; and he imagined all must willingly bow before her shrine. He may be said to be the founder of the only national work on English Botany; for though he did not live, or rather was not encouraged enough, to accomplish what would have justly entitled him to that character; yet he has opened the road of glorious renown to some one, who will hereafter achieve what he has commenced. The fault in not succeeding cannot be imputed to him, but in the times: 'Magnis, tamen excidat ausis.' He was, however, the precursor of the glorious lights of the present day; for he paved the way for the full reception of their labours. He impressed on the public a taste for the Science of Botany, although not then sufficient to maintain all his own works. He promoted, therefore, even his own contemporary rivals. His garden was the only public thing of the sort in England; which evinces his ardent endeavours for the science. All his works were original: the contrivance of them sprang entirely from his own mind. His sacrifice of a lucrative profession may be blamed by some; but he apologized for this, in the bias implanted by Providence, for wise reasons, in different minds; and there is no lack of persons carrying on this honourable art. His attention to the Grasses, his publication on the Sea Kale, with his several works, evince a patriotic spirit ever glowing in his breast. He looked beyond this scene; for in none of these but he likewise recalls us to that power and goodness whence all things proceed. His person was rather short, and thick-built; his dress was uncommonly neat; his face was full and ruddy, and bespoke beneficence: health, at one period, glowed in his cheek. He possessed a politeness, intermixed with some formality; the approaches to him, therefore were easy, but obligated not to be too free; but where he saw a desire of learning, he was the first to follow the student, and point out to him instruction.

"To sum up the total: he was a sincere believer in Christianity; although it is doubted whether he died a Quaker. He was a true and faithful husband; an affectionate and tender father to an only daughter, on whom he bestowed a most liberal education, and implanted the best principles; a kind and generous friend, disinterested in the extreme, although the want of encouragement drove him from the difficult path of true and lasting fame—of that fame, which, if a fault, was his only one. Here let the curtain of our narrative be dropt, and the sympathizing tear be shed on those beautiful lines, which are inscribed on the tomb-stone of Mr. Curtis, who departed this life, July 7, 1799, aged about 53 years:

"While living herbs shall spring profusely wild,
Or gardens cherish all that's blithe and gay,
So long thy works shall please, dear Nature's child,
So long thy mem'ry suffer no decay."

The remains of Mr. Curtis were deposited, at his own request, in Battersea church-yard, opposite the west entrance of the church; a place selected by him, probably from its being a pleasant place, adjoining the Thames, and the neighbourhood of frequent scenes of enjoyment in herborizing excursions with his pupils; for which the weedy fields of Battersea were a peculiarly desirable spot.

The Botanical Magazine was continued, as before stated, by Dr. John Sims up to 1826, and since by Professor Hooker, for the benefit of the daughter and grand children; the daughter having married in 1801, Mr. Samuel Curtis, then a florist at Walworth, and now a very extensive cultivator in most branches of horticulture at Glazenwood, near Coggeshall, in Essex. And it is with extreme regret we have to state, that this amiable lady, who possessed, in a great measure, the mind, disposition, and

pursuits of her father, died on July the 2d of this year (1827) leaving six sons and seven daughters to regret their loss. Her complaints were also similar to her father's for a year or two previous to her decease; but the immediate cause of her death was inflammation of the lungs, from a cold, which lasted but a fortnight; during which time she evinced the fruits of a well-grounded hope of a happy eternity; perhaps mainly attributable to the studies she made in Natural History; looking through the works of Nature up to Nature's God.
